Tables

The **Users** table manages essential account information and access to the system. It allows players to log in and provides a separation between gameplay data and account data.

The **player** table stores information about the in-game profile for each user. It stores data related to the gameplay and the internal progress of the player (in the game) which allows the system to manage player progression independently.

The **game stats** table stores performance data for each player such as total wins, losses and takedowns (of opponents / enemies).

The **card** table defines all available cards including the effect they have during gameplay. Which ensures that card information is not duplicated and allows decks to reference the same card data consistently.

The **deck** table stores information about the decks created by players. Each deck is associated with a player which allows strategy implementation. It keeps player data, card definition and the combination of cards separate.

The **deck cards** table is an intermediate table that represents the relationship between deck and cards. A deck can contain multiple cards and a card can appear in many decks. This table prevents redundancy and stores the quantity of each card in a deck.

The **GameSession** table stores information about each race, the date it was played and how long it took for the user to complete it.

The **player_game** table is an intermediate table that connects players and gamesessions, it captures participation data and performance.

The **CARD_stats** intermediate table tracks the interaction between the user and the cards for example usage patterns which is useful to balance the game.

The **enemies** table stores the information of each type of enemy and in which races they appear, as some don't appear in the first races.
